

# CanDIG's Evolving Search Backend

# CanDIG v1 Prototype

- Based on UCSC pre-GA4GH Connect “genomics API server”
- Used to validate federation approach for Canadian national projects

# CanDIG v1

- Based on UCSC pre-GA4GH Connect “genomics API server”
- Prototype used to validate federation approach for Canadian national projects
  - PROFYLE
  - TF4CN
- Demonstrating feasibility

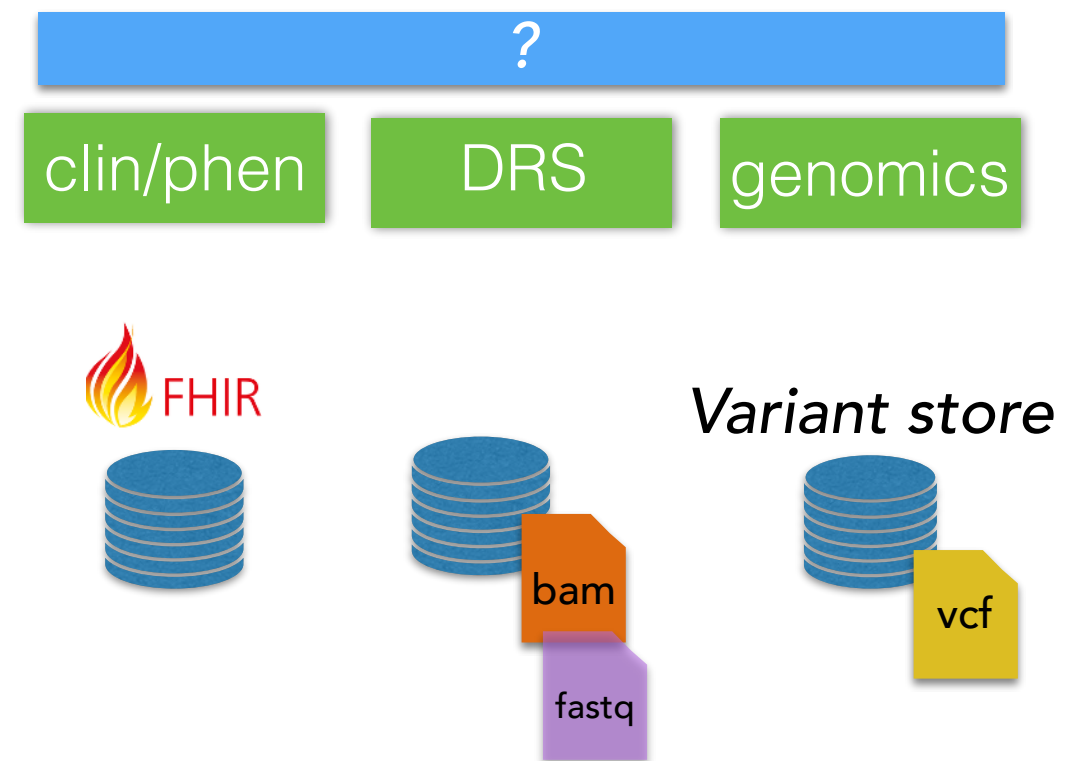

# CanDIG v1

- Custom metadata schema, aimed for cancer projects
- Simple custom query language for querying across data types
  - Adding RNA expression, imaging metadata, other services...
- Don't want to keep manually updating query engine

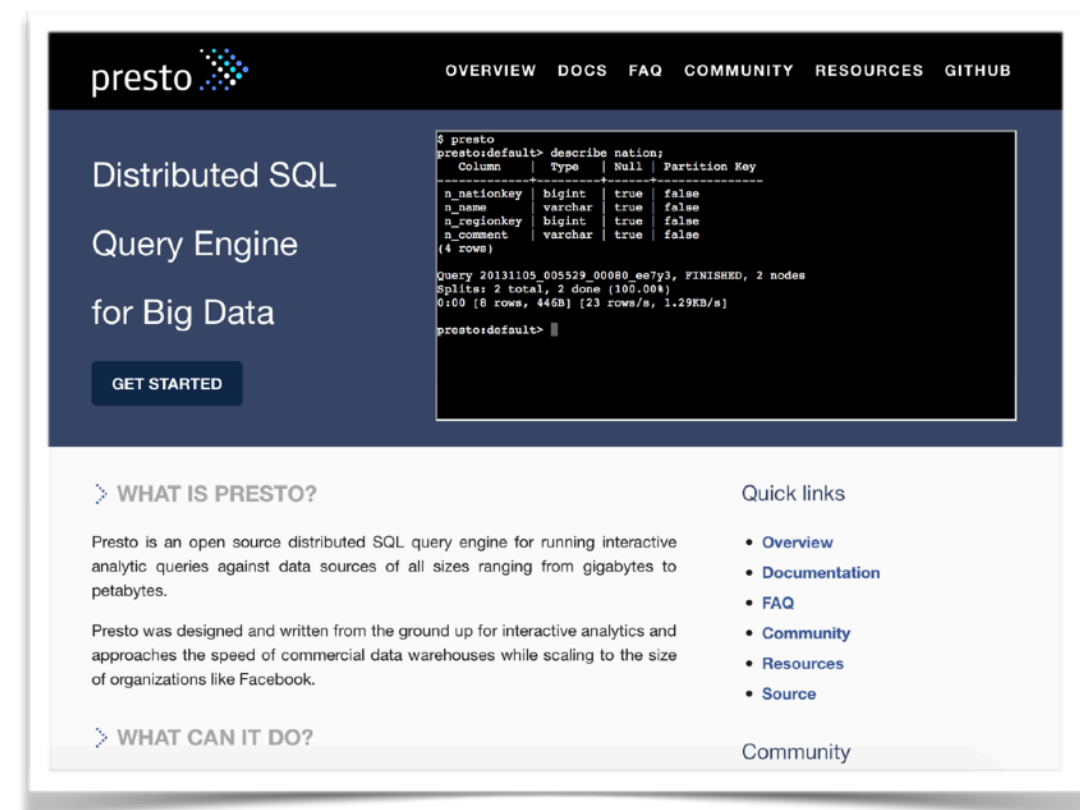

# CanDIG v2 Prototype

- Adopting FHIR for clin/phen
- GA4GH DRS for data catalog & pipeline/provenance info
- Currently auditioning tool to stitch cross-service queries together
  - <https://github.com/CanDIG/presto-graphql-testbed>

# PRESTO

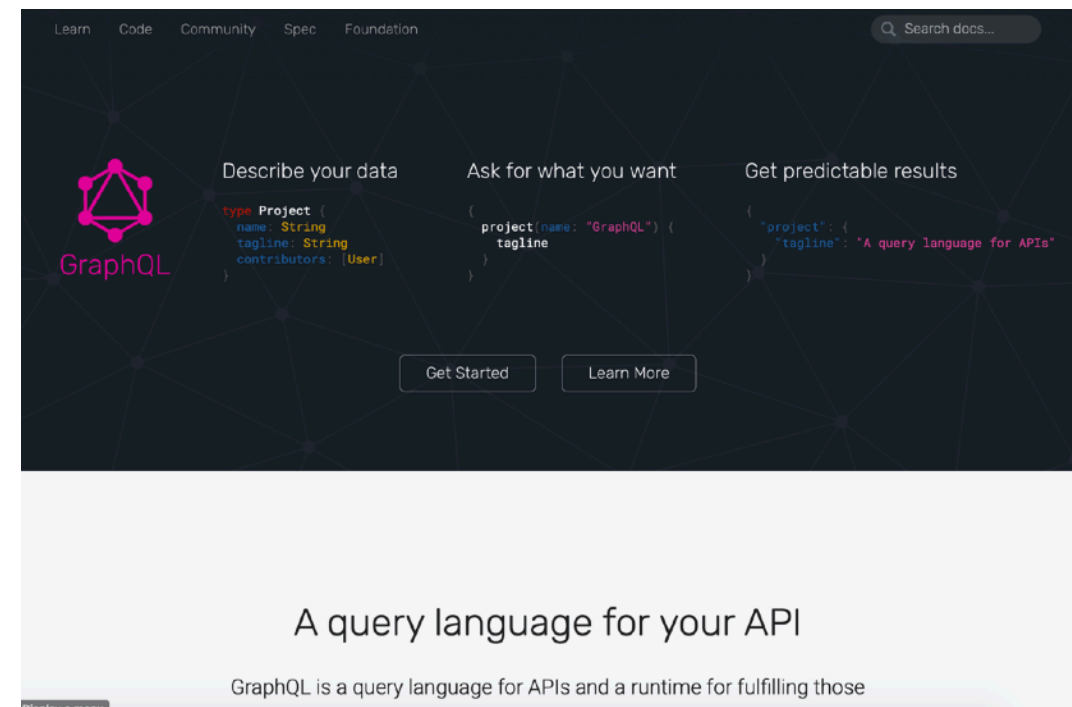

- SQL engine that can combine across multiple data sources
- Plugins for most databases
- Can configure API access
- Once connectors + schemas configured, can do regular SQL - full queries right away
- Like SQL, nested queries awkward
- Right now just connecting directly to underlying databases

<https://prestodb.github.io>

# GraphQL

- Query language & tool
- Aimed particularly at graph data
  - complex connections, nested queries
- Have to set up schemas *and* any filters, logic within queries/mutations
- Once done, arbitrarily nested queries quite straightforward
- Testing both directly to databases and across APIs

<https://graphql.org>
